Jaci, I have had zero luck getting RemoteMapper to work so I can get into the H drive. Here's what's been going on:

The sonic drill rig and the GCPT rig have both been on site for the second drilling mobilization, and they have completed the Phase 1C borings specified in the work plan. Most of the Phase 1B borings specified in the work plan have also been completed, and should be completed today February 3<sup>rd</sup>. Due to a very minor gamma peak found in Phase 1C boring 1C-2, the PRPs are proposing to step out and install one more GCPT push point outside of 1C-2, and to collect a few more GCPT push locations within the fence to obtain additional geotechnical information and refine the edge of the RIM. The step-out boring and other additional GCPT push locations should be completed the week of February 3<sup>rd</sup>. At least one more drilling mobilization will be needed, to collect the Phase 2 borings once their locations have been agreed upon, and to try again to recover sample material from location 8-1 where sample recovery has been very poor due to the loose nature of the waste there (interpreted by the PRP's contractor as auto shredder fluff). This drilling mobilization may need to wait until daytime high temperatures are above 32F, as the drill rig has been freezing up repeatedly during this drilling mobilization, requiring substantial time each morning just to get the rig operational.

Dan Gravatt received an e-mailed request directly from Virbac, a company across St. Charles Rock Road from the West Lake Landfill site, on Friday January 31<sup>st</sup> for a face-to-face meeting with their Vice President of Operations to discuss the site. No detailed questions were provided. After consulting with EPA management, Dan will meet with the Virbac representatives at their facility at 11AM on Monday, February 3<sup>rd</sup>.
